Not illustrated. 1907 Excerpt: .the magnetic reluctance is not constant, then the shift will be less. Experience has shown that in such machines the shift is about 0.5 of what the vector diagram would indicate. The wattless component of current, however, has either a magnetizing or a demagnetizing effect, and its action, therefore, in both types of machines can be considered the same. (See Fig. 48.) In the following calculations the armature reaction is represented by m_1 or m_0 , where T_0 is $V_2 i$ for two phase machines, and $1.5 v_2/$ for three phase machines. T_0 , the corresponding figure for the energy current in definite pole machines, is $0.5 m_1 t$, t , the number of armature-turns per pole and phase and / the effective current. The self-induction of the machine is caused by the flux which is set up by the armature current, and which does not interlink with the main...
